

FlexForge — Code Flow Diagrams

Visual walkthrough of how a request flows, how the engine boots, how a flow runs, and the module map · v0.1.0

1. Request flow (architecture)

Every protocol is a thin surface over one CRUD engine; data changes fan out to real-time and audit via the EntityEvent stream.

2. Startup sequence

What happens when the engine boots and interprets the config bundle.

3. Flow engine execution

How a no-code flow runs: the engine walks the step graph, each step is resolved from the registry and executed against the shared context.

4. Module map

The modular-monolith package structure.

config / config.model

schema (dialects, DDL)

data (CRUD, validate, idempotency)

auth + crypto

flow + flow.steps

realtime (SSE/WS)

audit / notify / ai

api.* surfaces

bootstrap (composition root)
